CONTENTS

In this guide

01 Understand the result

02 Read cleanup counts correctly

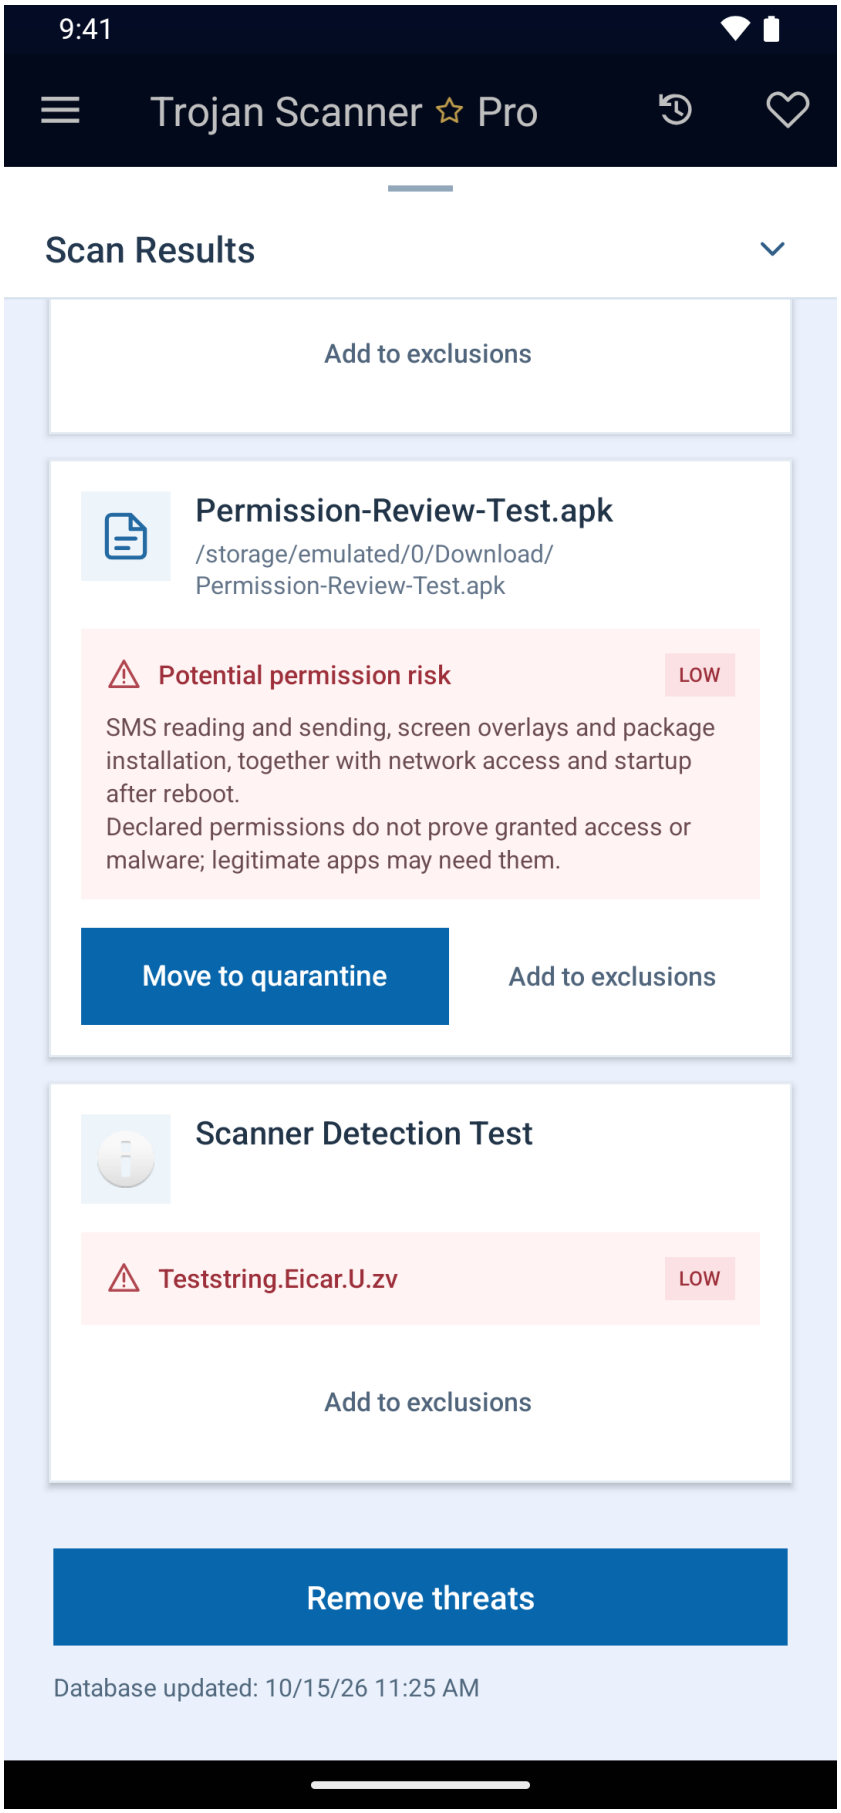

03 Review Protection history

04 Use What changed

Trojan Scanner separates a scan’s findings from its coverage. Read both: a result may contain useful completed checks while some items remain unchecked. Protection history saves activity; What changed helps you decide what to review next.

01 Understand the result

- **No threats detected:** the completed checks found no matching threat. This is not a guarantee of safety.
- **Threat detected:** an item matched a detection rule in a local or enabled cloud database. Open its details before choosing an action.
- **Potential permission risk:** a combination of declared permissions deserves review. Declared permissions do not prove access was granted or that the app is malicious.
- **Potential surveillance risk:** Pro Anti Spy found a suspicious combination of capabilities. Review the app and its access; the warning does not establish that spying occurred.
- **Incomplete or partially completed:** some requested checks could not finish. There is no safety conclusion for items that were not checked.

Expand a finding to see why it needs attention. A permission or surveillance warning is a risk signal, not proof of spying.

02 Read cleanup counts correctly

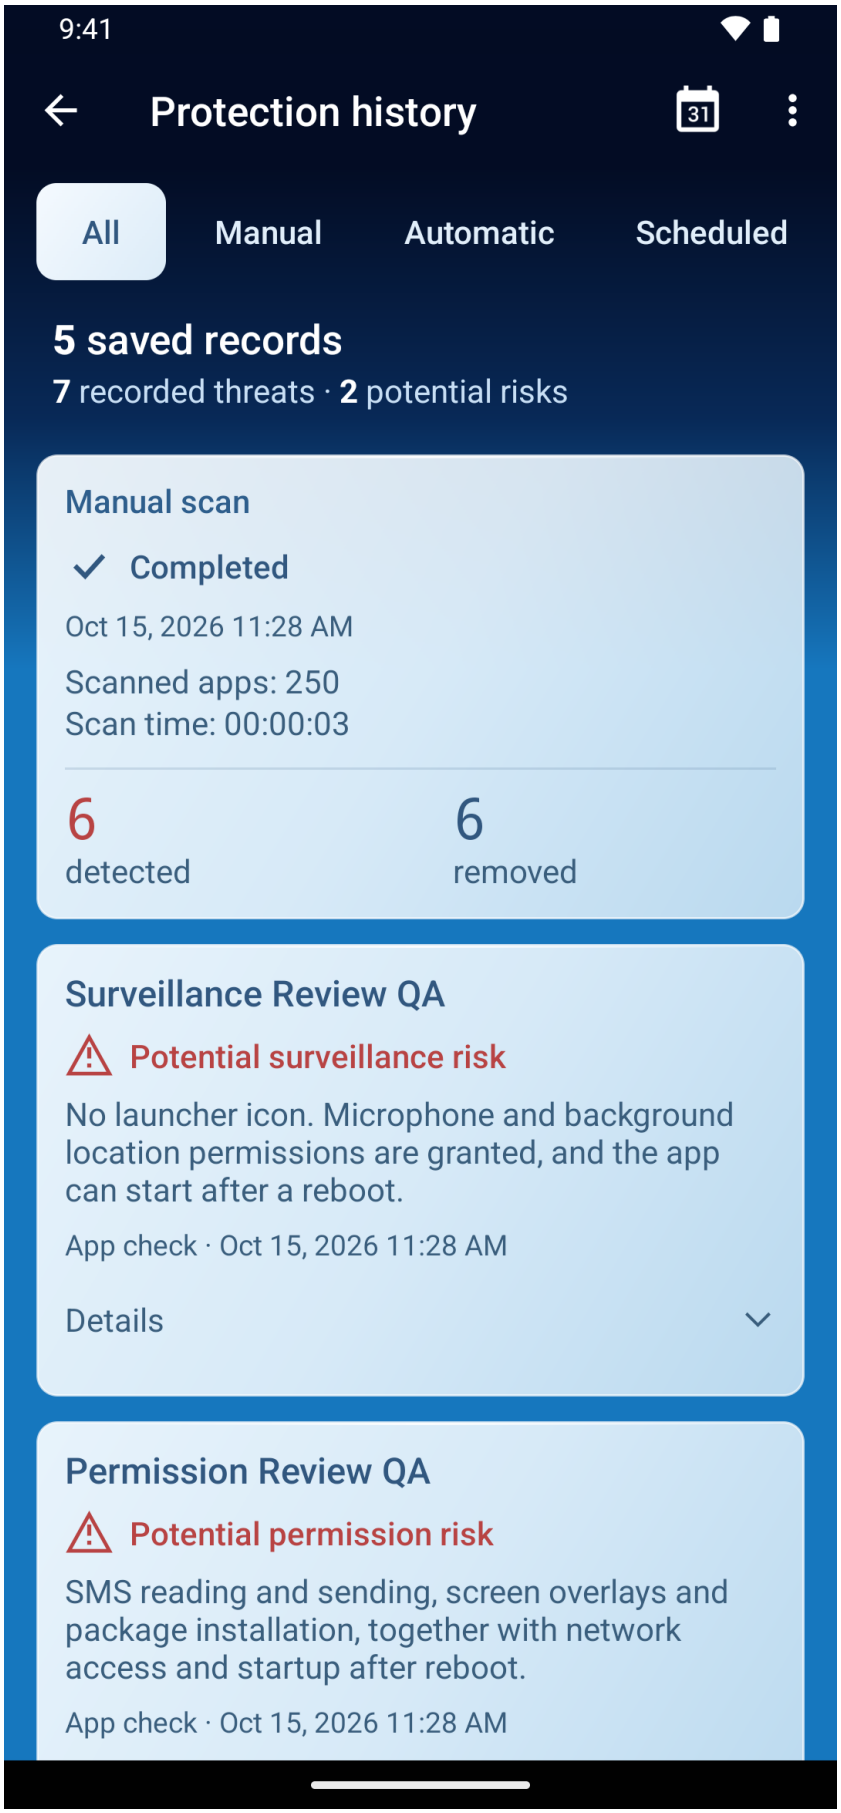

The main **Threats** count groups findings. Open **View details** to distinguish known-threat matches from potential permission or surveillance risks.

Removed counts successful treatment. **Excluded** means the item was skipped, not removed. **Detections left** and **Not checked** need separate attention. Canceling Android’s uninstall confirmation leaves the app installed and the finding unresolved.

See how to manage each finding. Test-sample screenshots in these guides demonstrate the controls; your detections and counts will differ.

03 Review Protection history

Tap the **Protection history** shortcut beside Start, or open it from the menu. It brings together manual scans, automatic checks of new or updated apps, and saved Pro background scans.

App check · Oct 15, 2026 11:28 AM

Review saved activity by source, findings or date. History describes past checks, not the device’s current status.

1. Choose **All**, **Manual**, **Automatic** or **Scheduled**.
2. Use **With findings** or a date filter to narrow the list.
3. Open an entry to review its available details. Older per-app details may have expired.

A repeat check of the same app is still a separate activity. Manual report retention is controlled in Settings. An empty filtered list means no matching saved activity; try another source or date. Saved history remains readable after Pro ends.

04 Use What changed

Tap the other small home-screen shortcut, **What changed**. Long-press either small icon to see its label. Complete a device check first to establish a reference. The view highlights newly observed app installations or reinstallations, newly enabled special access and saved findings.

Protection history

What changed helps focus your review. Special access by itself is not a threat.

Expand a card for details, open the app’s Android settings, or review an available removal or exclusion action. Screen access through accessibility, notification access and device administrator access may be legitimate; check whether you intended to enable them.

Opening this view does not run a fresh scan. A stopped or incomplete scan does not replace the completed-check reference. Changes saved at the last completed check stay available separately from newly observed changes.
