CONTENTS

In this guide

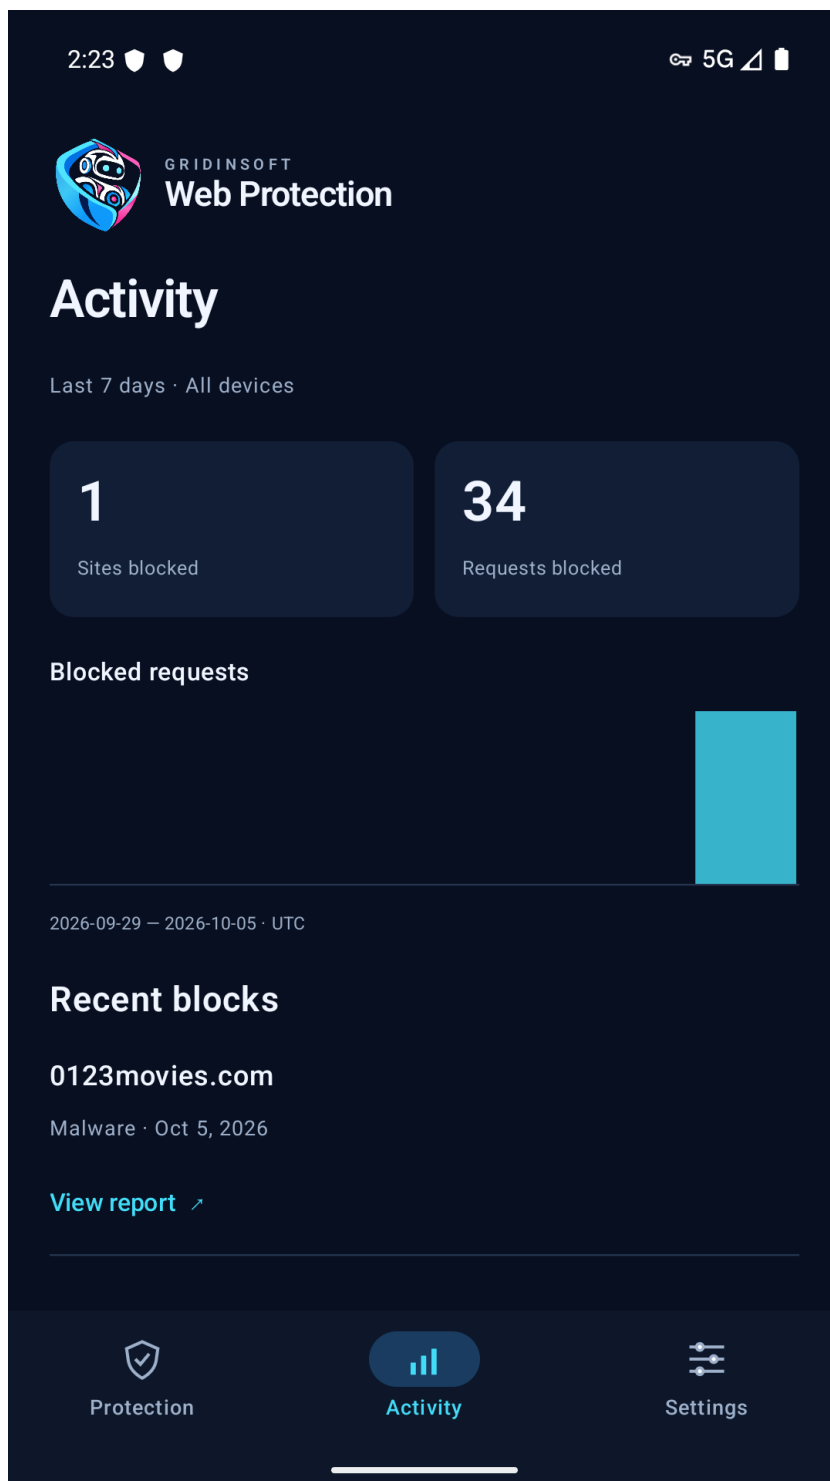

- 01 Requests and domains count different things
- 02 Review a block safely
- 03 Empty, partial or old activity

Open **Activity** to review recent blocking activity. The current Android screen shows the last seven days; its chart uses UTC dates. Check the scope label before comparing numbers.

01 Requests and domains count different things

- **Sites blocked / Domains blocked** counts distinct blocked names within the displayed scope and period.
- **Requests blocked** counts DNS requests. One domain can generate many requests because of retries, different DNS record types, or background apps.
- **All devices** is account-wide activity. An unsaved guest installation shows **This device** instead.

These numbers are not a count of website visits, infections or people attacking your phone. A request can happen without opening a browser.

Example Activity screen from version 0.5.9. The shown domain and counts describe that recorded result, not a recommendation to visit the site or a permanent classification.

02 Review a block safely

Find the domain in **Recent blocks** and use **View report** when available. This opens the Gridinsoft security report. A missing category or report link means those details are not available yet; the app should not invent them.

The **Latest block** card on Protection is a separate local record for this phone. It covers recent alerts from the device and can differ from account totals.

03 Empty, partial or old activity

Use **Refresh** and check the last-update time. Collection can take time, and a failed refresh may leave saved data on screen. A zero count is not evidence that protection is off; a stale count is not proof that it is on. Check the Protection tab for the current connection state.

The **Check a website** shortcut opens the online reputation checker. Its report is separate from confirming this phone's active DNS connection.

NEED MORE HELP?

We are here when the guide is not enough.
